Task 1: Network Setup

We set up the environment as follows:

```
i)-[~/Labsetup]
        ® |
   docker-compose build
VPN_Client uses an image, skipping
Host1 uses an image, skipping
Host2 uses an image, skipping
Router uses an image, skipping
   (root@ kali)-[~/Labsetup]
docker-compose up
Creating network "net-10.9.0.0" with the default driver
Creating network "net-192.168.60.0" with the default driver

 state UNKNOWN group default glen 500
    link/none
12: eth1@i+13: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc noqueue state
UP group default
    link/ether 02:42:c0:a8:3c:0b brd ff:ff:ff:ff:ff:ff link-netnsid 0
    inet 192.168.60.11/24 brd 192.168.60.255 scope global eth1
       valid_lft forever preferred_lft forever
14: eth0@if15: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc noqueue state
UP group default
    link/ether 02:42:0a:09:00:0b brd ff:ff:ff:ff:ff:ff link-netnsid 0
    inet 10.9.0.11/24 brd 10.9.0.255 scope global eth0
```

Also, this is done automatically by adding the commands to the code:

valid_lft forever preferred_lft forever

root@8e8b861b1822:/#

```
# Create the tun interface
tun = os.open("/dev/net/tun", os.0_RDWR)
ifr = struct.pack('16sH', b'shebu%d', IFF_TUN | IFF_NO_PI)
ifname_bytes = fcntl.ioctl(tun, TUNSETIFF, ifr)

# Get the interface name
ifname = ifname_bytes.decode('UTF-8')[:16].strip("\x00")
print("Interface Name: {}".format(ifname))

os.system("ip addr add 192.168.53.99/24 dev {}".format(ifname))
os.system("ip link set dev {} up".format(ifname))

while True:
    time.sleep(10)
```

```
root@8e8b861b1822:/# ip a

1: lo: <LOOPBACK,UP,LOWER_UP> mtu 65536 qdisc noqueue state UNKNOWN
ult qlen 1000
    link/loopback 00:00:00:00:00 brd 00:00:00:00:00:00
    inet 127.0.0.1/8 scope host lo
        valid_lft forever preferred_lft forever
6: shebu0: <POINTOPOINT,MULTICAST,NOARP,UP,LOWER_UP> mtu 1500 qdisc
state UNKNOWN group default qlen 500
    link/none
    inet 192.168.53.99/24 scope global shebu0
    valid lft forever preferred lft forever
12: eth1@if13: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc noq
```

Task 2.c: Read from the TUN Interface:

Code:

```
ifr = Struct.pack( 10SH , D SNebu%d , IFF_IUN | IFF_NO_PI)
ifname_bytes = fcntl.ioctl(tun, TUNSETIFF, ifr)

# Get the interface name
ifname = ifname_bytes.decode('UTF-8')[:16].strip("\x00")
print("Interface Name: {}".format(ifname))

os.system("ip addr add 192.168.53.99/24 dev {}".format(ifname))
os.system("ip link set dev {} up".format(ifname))

while True:
    packet=os.read(tun, 2048)
    if packet:
        ip=IP(packet)
        print(ip.summary())

while True:
    time.sleep(10)
```

First, On Host U, we ping a host in the 192.168.53.0/24 network. Specifically, we ping the 192.168.53.1 network. As the interface is not yet configured to get a reply back, we can see that packets were not received back. However, being in the same LAN network, the packets get sent successfully.

Now, on Host U, we ping a host in the internal network 192.168.60.0/24. Specifically, we ping the 192.168.60.5 network. Similar to before, we can see that no packets are received. However, in this case, no packets were sent out as well due to which the client

side screen is blank as it tried sending out packets to network outside of the host network which is unreachable

```
root@deeb5999b181:/# ping 192.168.60.5
PING 192.168.60.5 (192.168.60.5) 56(84) bytes of data.
^C
--- 192.168.60.5 ping statistics ---
18 packets transmitted, 0 received, 100% packet loss, time 17409ms
root@deeb5999b181:/#
```

Task 2.d: Write to the TUN Interface

We modified the code so that a spoofed packet is sent out with src IP as 192.168.53.3:

```
while True:
    packet = os.read(tun, 2048)
    if packet:
        ip = IP(packet)
        print(ip.summary)

    newip = IP(src='192.168.53.3', dst=ip.src)
        newpkt = newip/ip.payload
        os.write(tun, bytes(newpkt))
```

We run the code to see that packets were sent and received successfully

```
rootadeeb5999b181:/# ping 192.168.53.3 |

PING 192.168.53.3 | 192.168.53.3 | 56(84) bytes of data.

```

Instead of writing an IP packet to the interface, we modify the code to write some arbitrary data to the interface to send it as bytes:

```
while True:
    packet = os.read(tun, 2048)
    if packet:
        ip = IP(packet)
        print(ip.summary)

    newip = IP(src='192.168.53.3', dst=ip.src)
        newpkt = newip/ip.payload
        arb_data = b'Any arbitrary data'
        os.write(tun, arb_data)
```

We run the code to see the output as follows:

```
rootadeeb5999b181:/# python3 tun.py
PING 192.168.53.3
Find 192.168
```

Task 3: Send the IP Packet to VPN Server Through a Tunnel Tun-server.py code:
